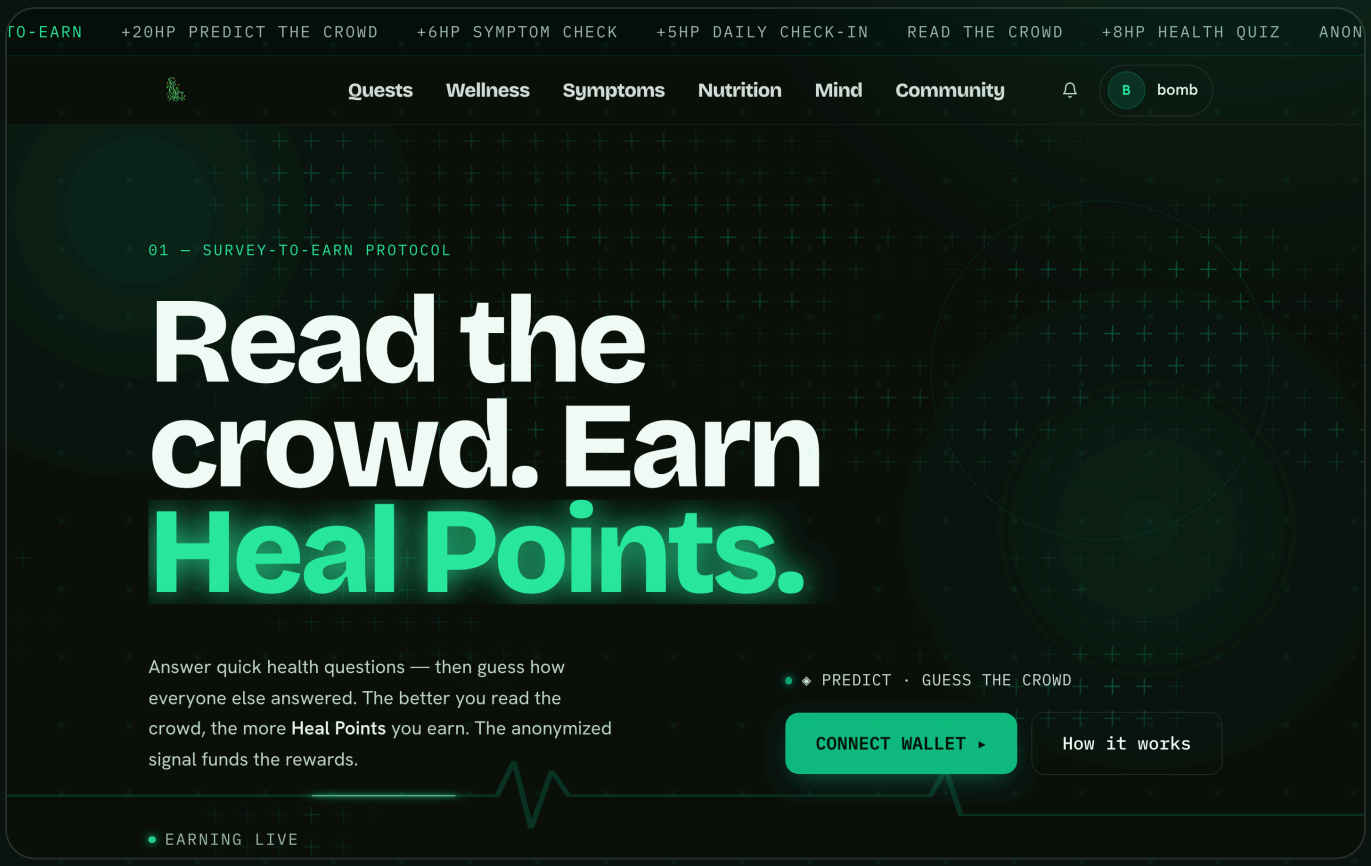
HEALTH SAVIORS · DEMO WALKTHROUGH

See the loop, screen by screen.

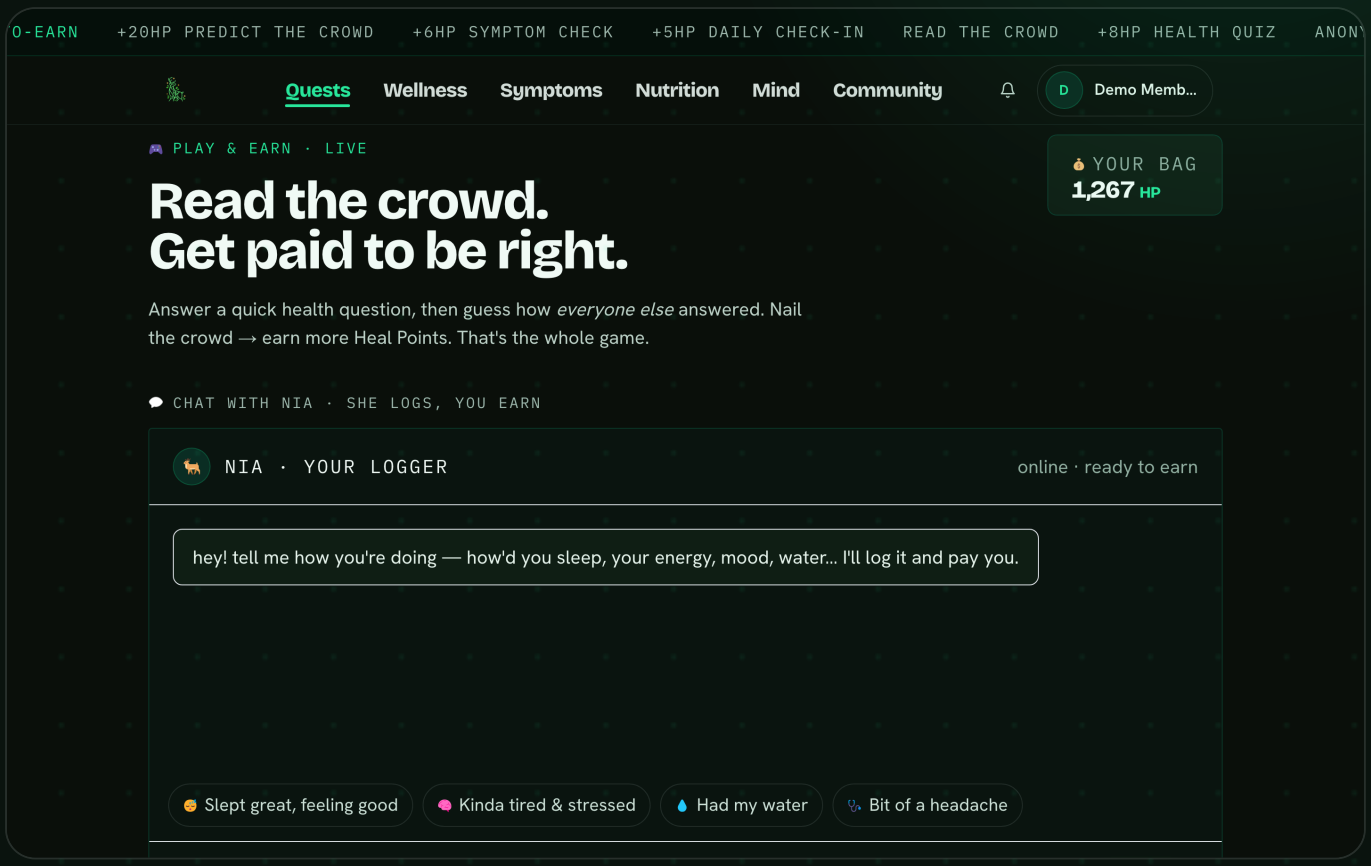
Every capture in this document is the live product at saviorofhealth.app — real panel data, real aggregates, k=5 anonymity throughout. A 2-minute video version accompanies this PDF.

The pitch, on arrival



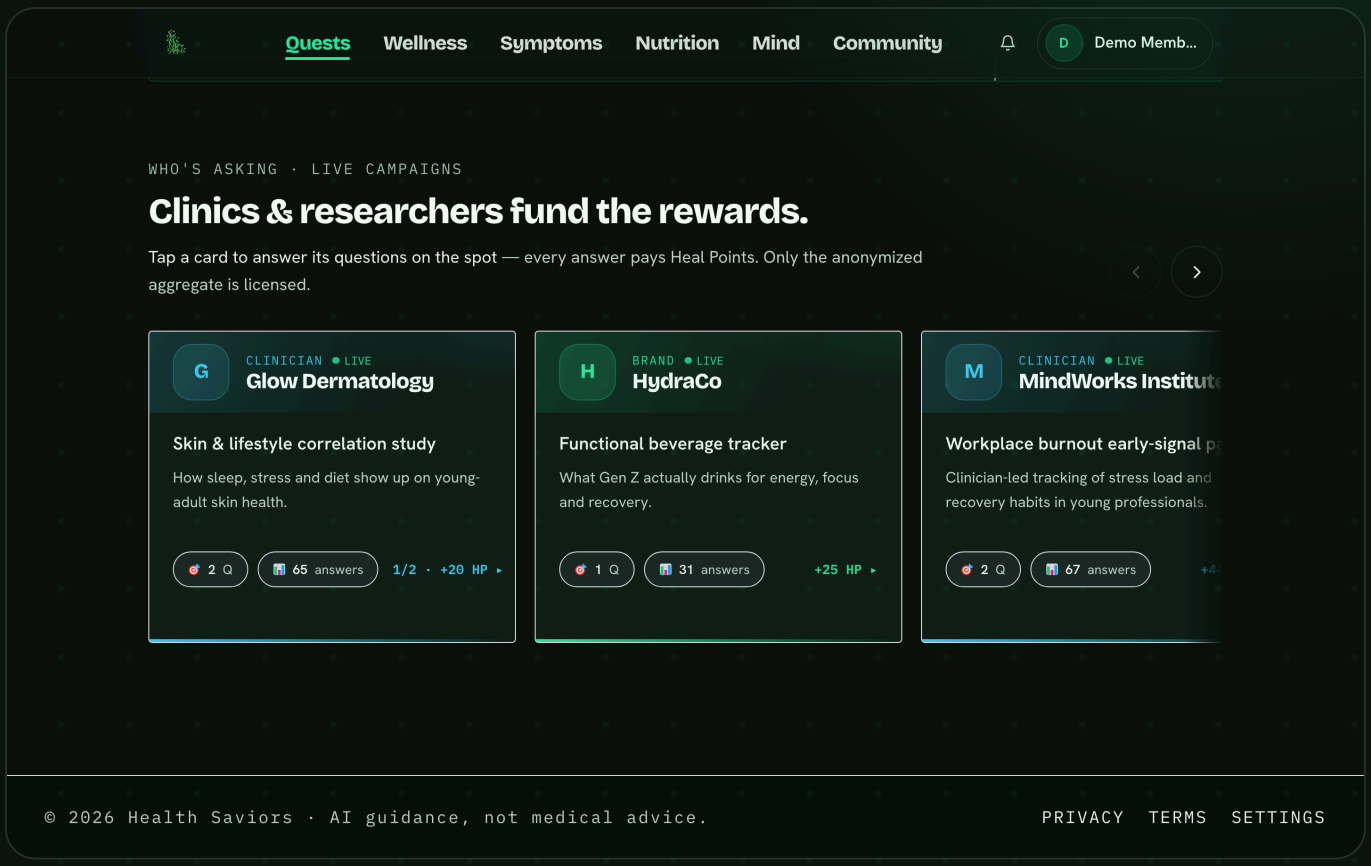
The landing states the deal plainly: answer health questions, read the crowd, get paid in Heal Points — while clinics fund the rewards and only anonymized aggregates are licensed. **Try:** scroll the full page; every section mirrors a live feature.

Quests — chat with Remi



Members describe their day in plain words; Remi logs it (sleep, water, mood…) and pays check-in rewards. Clinician campaign questions appear inside the conversation — one tap to answer, instantly rewarded, anonymously delivered. **Try:** type "slept 6h, feeling tired" and watch the chips.

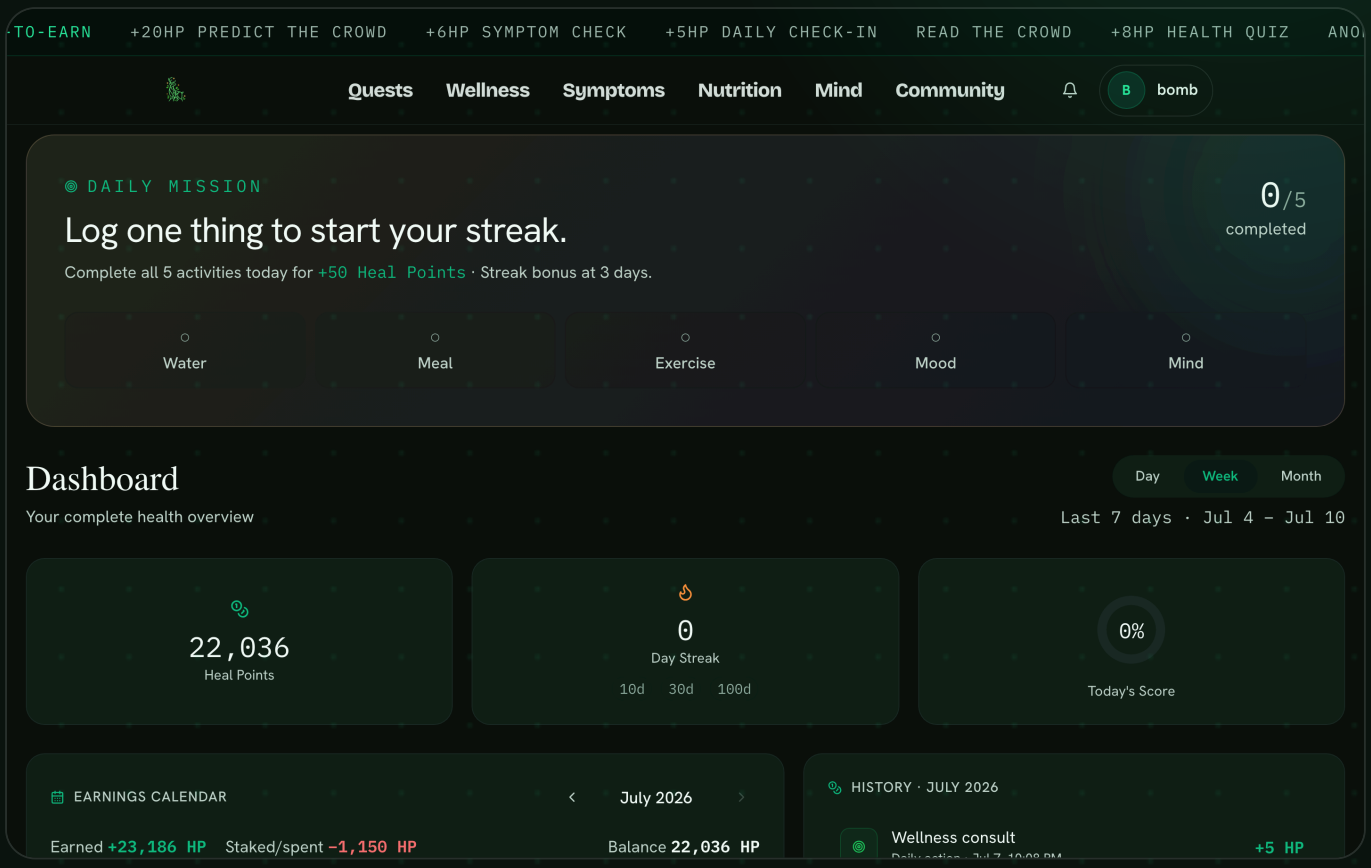
Who’s asking — answer in place



Live campaign cards show the commissioning org, question count, response volume and the HP on offer. Tapping opens an answer sheet — options, instant HP, progress to ✓ ANSWERED. **Try:** open a card and answer both questions.

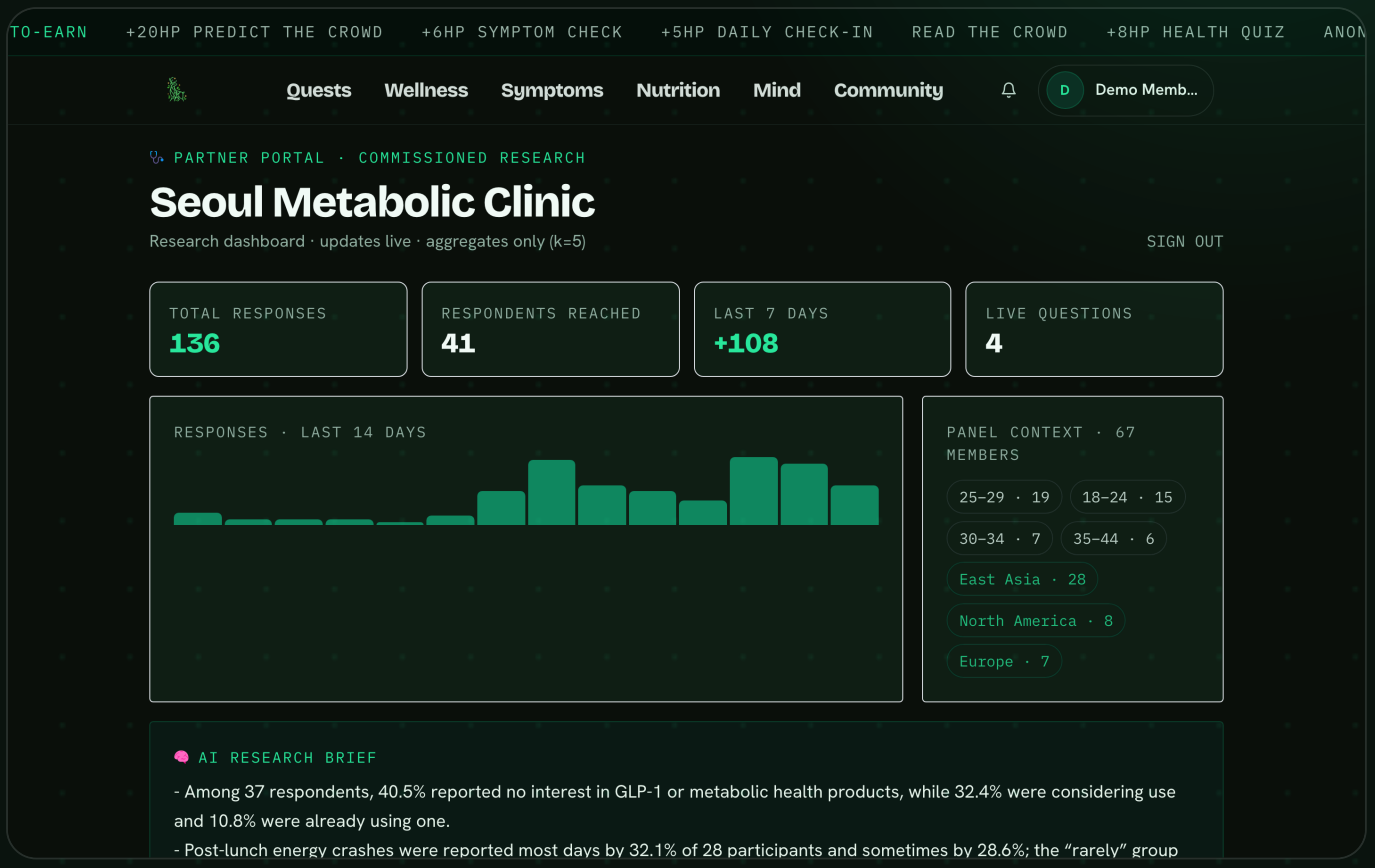
HEALTH SAVIORS · DEMO WALKTHROUGH

Every point, accounted



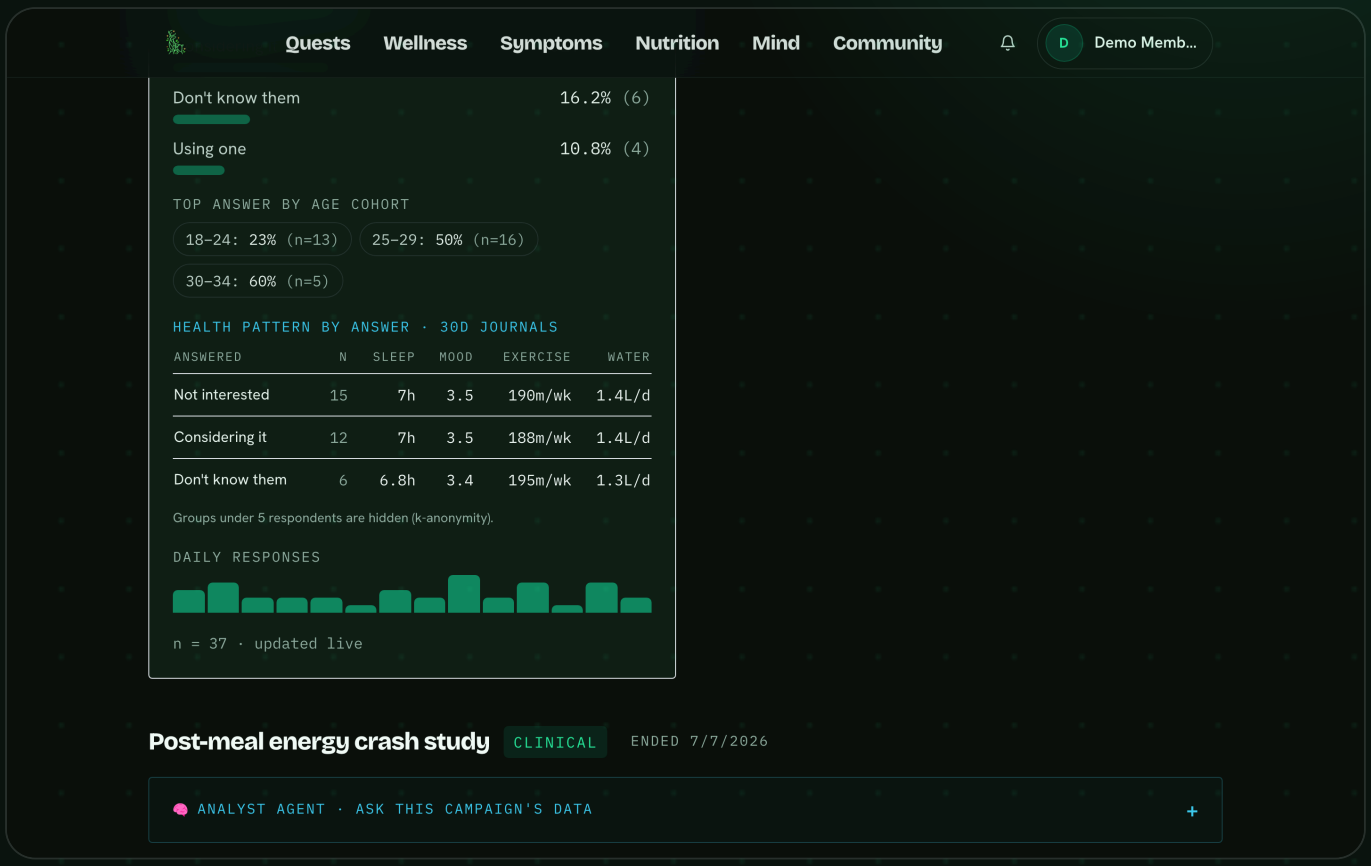
The dashboard's earnings calendar heat-maps daily HP; tap a day to filter the full transaction history beside it — survey rewards, crowd-guess bonuses, daily actions, stakes, badges. **Try:** tap the brightest day.

The clinician console



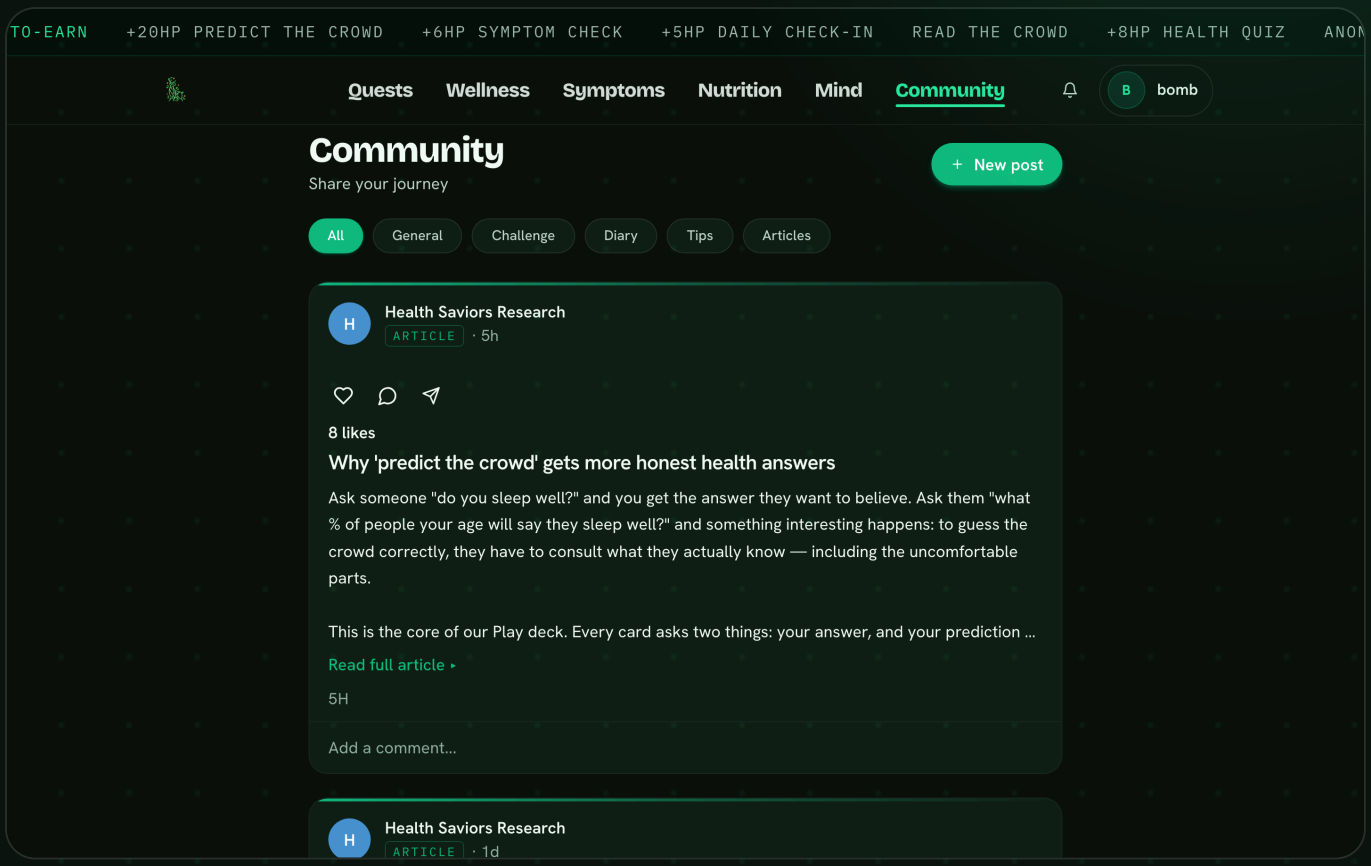
Partners sign in with their access key and see only their own campaigns: response velocity, panel context, an AI research brief, per-question distributions with age cohorts and CSV export. The respondent baseline strip summarizes the panel’s wellness. **Try:** /partner with an issued hs_live_ key.

Patterns & the analyst agent



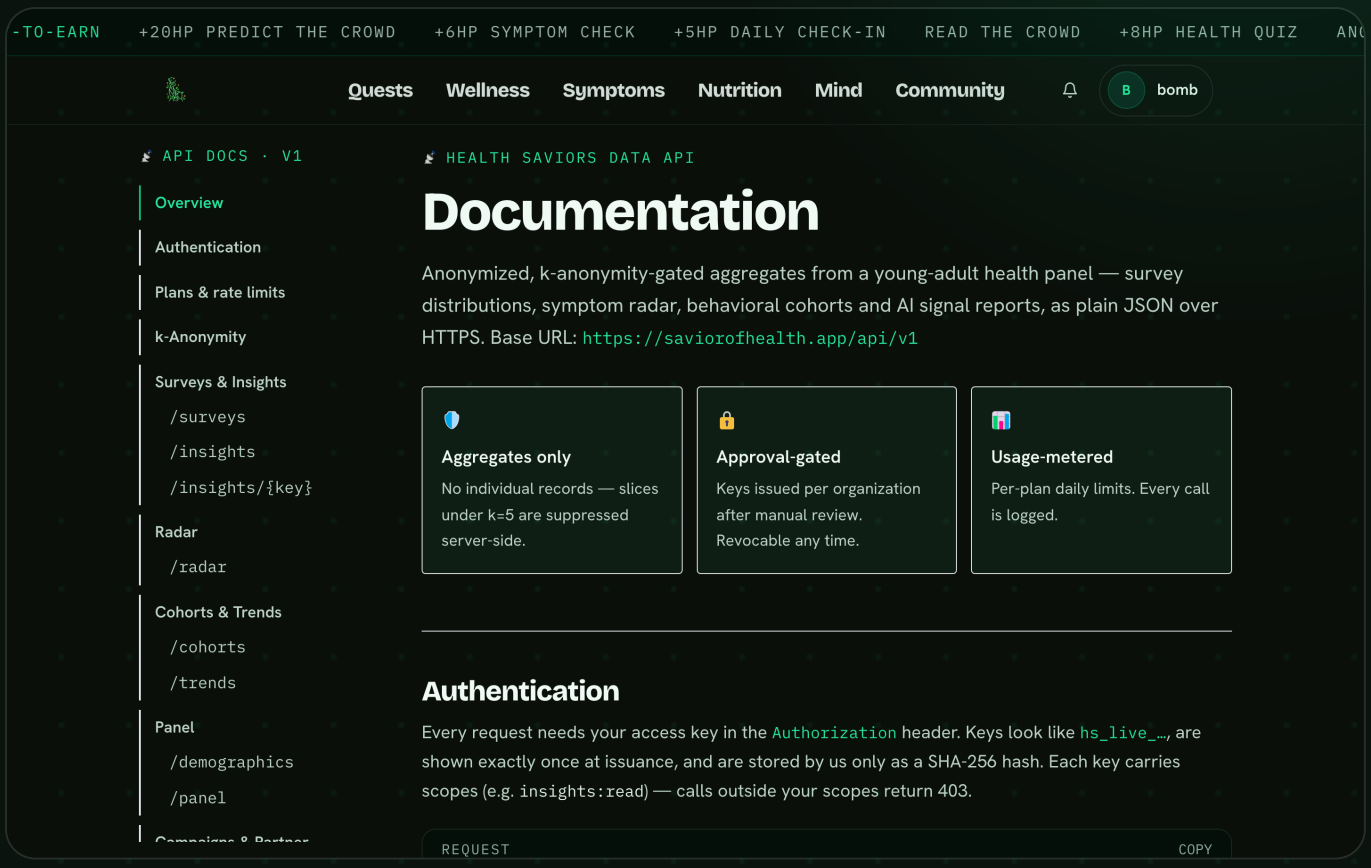
The differentiator: each question's **health-pattern table** splits respondents by their answer and shows each group's 30-day sleep, mood, exercise and water — k=5 suppressed. The analyst agent chats over exactly these aggregates: ask "which group looks at-risk?" and get numbers, caveats and a suggested follow-up question. **Try:** the starter chips.

Community & research articles



A photo feed of member experiments and challenges, plus an **Articles** tab for long-form research writing — methodology posts from our team and, ahead, external collaborators. **Try:** the Articles tab.

The Data API



A key-gated REST API exposes the same aggregates programmatically — insights, radar, cohorts, trends, demographics, campaign results — with scoped keys, plan rate limits and the k=5 gate baked in. Full request/response reference at /developers; product reference at /docs. **Try:** the access request form.
